RE-1

Residential Telephone Entry System

With Built-in Wireless Receiver

Installation,
Programming,
and Operation Instructions
Two-way speakerphone

- Call waiting
- Call forwarding
- Distinctive rings for access calls
- Seven access time zones
- Timed “Do not disturb” privacy feature
- Digitally synthesized human voice prompts
- Residence control of relays
- Programmable relay control prefixes
- 100 entry code capacity
- 1-6 digit entry code length
- Each entry code can be programmed to activate either or both relays
- 100 transmitter capacity
- Supports 24 blocks of transmitters
- Supports MGT safety edge transmitter
- Internal clock and calendar with battery backup
- Event log memory retains the last 450 system events
- Keypad programmable
- Locally & remotely programmable with a telephone or computer
- Programming software built-in, connect with any internet browser
- Weather-proof, tamper-resistant housing
- Superheterodyne radio receiver
- Integral radio antenna
- Remote keypad support
- Bright white LED downlight
- Piezo sounder
- 2 heavy duty form “C” (N.O. & N.C) relay outputs
- Timed anti-passback
- Keypad lockout
- Tactile key feel
- Two door sense/inhibit inputs
- Two open request inputs
- Access keyswitch provision
- Removable terminal blocks
- Optional CCTV camera with infrared illuminators
**PRODUCT DESCRIPTION**

Linear's RE-1 Telephone Entry System is designed for residential or light commercial access control applications. The speakerphone, keypad, radio receiver, and optional video camera are housed in a rugged enclosure that can be mounted to a pedestal or bolted directly to a wall. The die-cast keypad keys have bright, easy-to-read graphics and are lit with an overhead light. The two operation buttons; CALL and HELP, are machined for heavy-duty reliability.

**Operation**

Arriving visitors will approach the unit and place a call to the residence by pressing the CALL button. The RE-1 will acquire the residence’s local telephone line and generate distinctive rings to the house telephones. The resident, knowing that the distinctive ring is originating from the access area, can answer any house telephone and converse with the visitor. If the resident decides to grant access to the visitor, they can activate either output relay in the RE-1 by pressing a key on the telephone's keypad. If the resident decides not to grant access, hanging up or pressing a key will disconnect the visitor's call.

**Call Waiting**

If the resident is using the telephone at the time a visitor calls, the RE-1 will sound beeps on the telephone line to announce that a visitor is calling. The resident can press a key on the telephone to place the outside caller on hold and communicate with the visitor. After granting or denying access to the visitor, the outside caller will be re-connected to the resident.

**Call Forwarding**

Programmable call forwarding allows the RE-1 to dial any selected telephone number when a visitor presses the CALL button. For example, with call forwarding enabled, the RE-1 could dial a cell phone to contact the resident while outside or away from the residence. The resident will be able to communicate with the visitor and grant or deny access from the remote telephone.

**Alternate Numbers**

For installations where multiple residences exist inside the same controlled opening (such as a guest house or granny flat) three alternate calling numbers can be programmed. The alternate numbers can be called by entering a short code at the keypad.

**Local Control**

The resident can issue control commands from the local telephones without a call from a visitor. By dialing a specific series of digits, the resident can control either of the two relays. The resident can also initiate voice communications with the entry system.

**Access Media**

Up to 100 entry codes, from 1 to 6 digits in length, can be programmed. Each entry code can activate either, or both, of the relay outputs. Linear’s Model AM-KP keypad can be used as a secondary remote keypad for the RE-1.

Up to 24 sets of block coded MegaCode® transmitters (up to 100 transmitters total) can be used to gain access through the RE-1’s built-in radio receiver. Each transmitter can be individually suspended or re-activated. One facility code can be programmed to identify each block of transmitters. **Programming of individual (non-block coded) transmitters is not supported by the RE-1.**

**System Features**

**Time Zones**

The RE-1 contains an internal clock and calendar. Seven programmable “time zones” allow setting time periods to schedule system functions. Each time zone can be active or inactive on certain days. Keypad entry codes, wireless transmitters, automatic access control, call forwarding, and the “Do Not Disturb” feature can each be set to only be active during a specific time zone period. Up to ten “holiday” days can be programmed. Each of the seven time zones can be set to be active or inactive during a holiday.

**Portal Supervision**

The SENSE/INHIBIT input can be used two ways. If programmed for “door sense”, a switch on the door detects forced entry or door ajar situations. If programmed for “inhibit”, the input can be wired to a “service” switch or automatic timer that will disable the Relay #1 when required.

**Hardwired Activation**

The OPEN REQUEST input can be wired to an exit loop detector or exit photo beam to allow automatic exit activation. An emergency access keyswitch can be mounted in the RE-1 case to allow keyed entry for authorized personnel.

**Access Security**

The “anti-passback” feature allows the option of preventing the use of the same code or the same transmitter again before the programmed time elapses. The “keypad lockout” feature discourages tampering by disabling the keypad for one minute after a programmable number of incorrect entry codes has been entered at the keypad.

**Event Log**

An access log of up to 450 events is stored in the unit’s memory. System activity is logged as it occurs with the date and time of the event. The access log data can be retrieved locally or remotely with a computer through the RE-1’s built-in modem.

**Local & Remote Programming**

The system’s built-in programming software can be accessed on-site or off-site using a computer with any Internet browser. The software’s graphic display of each of the programming steps make programming easy. Without a computer, the RE-1 can be programmed with its main keypad, from any local telephone connected to the same line, or by calling from any remote telephone.

The EEPROM memory retains all entry codes, transmitter information, and programming, even without power.

**Obstacle Detection**

Linear's Model MGT safety edge transmitter is compatible with the RE-1. This MGT detects and transmits obstacle events to the RE-1 receiver. Obstacle signals from an MGT transmitter will activate Relay #2.

**Alarm Interface**

Relay #2 can be programmed for alarm shunt to bypass an alarm loop during entry, or alarm trigger to cause an alarm during forced entry. Four activation options are available for Relay #2.

**Voice Synthesizer**

A built-in voice synthesizer sounds voice prompts through the speaker, local and remote telephones.
INSTALLATION INFORMATION
Before beginning installation, please review the entire instructions and become familiar with the system’s operation, wiring, and programmable options.

System Location
For pedestrian door or gate installations, mount the Entry System on a rigid wall near the controlled door. Avoid mounting the unit in a location where regular mechanical shock will occur due to a slamming door or spring loaded pedestrian gate.
For vehicular gate installations, mount the Entry System in clear view of the gate, but far enough from the gate so the user cannot touch the gate from the keypad.

★ WARNING FOR ALL GATE INSTALLATIONS: TO AVOID SERIOUS INJURY OR DEATH, MAKE SURE THAT THE UNIT IS FAR ENOUGH FROM THE GATE SO THAT THE USER CANNOT TOUCH THE GATE WHILE OPERATING THE KEYPAD. HOWEVER, FOR SAFETY, THE GATE MUST BE FULLY VISIBLE FROM THE KEYPAD.

RFI Filter Installation
An in-line ferrite RFI filter has been included with this unit to install during the wiring of the RE-1 Residential Telephone Entry System.

✦ NOTE: To insure FCC Part 15 Class B compliance, the following steps must be performed at the time the RE-1 is installed.
1. Open the ferrite RFI filter case by gently pulling on the side locking tab and swinging the case open (see Figure 1).
2. After completing the RE-1 installation, route all wires except the AC transformer and telephone lines through the groove in the ferrite core of the RFI filter. The filter must be installed outside of the RE-1 case. With the wires captured inside, close the ferrite RFI filter case and snap it shut (see Figure 1).
3. Be sure the filter is located no further than two inches from the rear case cover of the RE-1.

Telephone Wires
The quality of the system’s audio communications is related to the type of telephone wire and its installation. Noise and hum can be introduced into the telephone wires. Use only high-quality telephone wire rated for direct underground burial. All telephone wire should be twisted-pair.
- Minimum size of 24 AWG for up to 800 feet.
- Minimum size of 22 AWG for up to 1600 feet.
- Minimum size of 20 AWG for up to 2200 feet.
- Minimum size of 18 AWG for up to 3600 feet.

DO NOT ROUTE TELEPHONE AND AC WIRING INSIDE THE SAME CONDUIT. Route all telephone wires inside a dedicated conduit that is at least six inches away from any AC line wiring.

Power Supply
Use the supplied 16-volt 20-VA transformer to power the RE-1. DO NOT POWER ANY OTHER EQUIPMENT FROM THE SAME TRANSFORMER, use a separate power supply. Keep the system power wires as short as practical to reduce the chance of noise and hum pickup.
- For low voltage power wire runs up to 100 feet, use 18 AWG, THHN 600-volt insulated wire.
- For low voltage power wire runs up to 200 feet, use 16 AWG, THHN 600-volt insulated wire.
- Use 22 AWG or larger (depending on the load) for all other connections.

ALWAYS REMOVE POWER PRIOR TO SERVICING

Earth Ground
To avoid damage to the unit from static discharges, connect the RE-1’s EARTH GROUND and case ground terminals to a good earth grounding point within 10 feet. The case ground terminal is the #8 screw located on the backplate above the wire entry hole. Also, the RE-1’s Telephone Bypass Module must be grounded to provide surge protection for the telephone line. Suggested wiring size is 12 AWG for earth ground.

Removable Terminal Strips
For convenience, the RE-1 is provided with removable terminal strips. It is important that these strips be removed evenly in order to avoid causing permanent damage to them.
1. Be certain power is off before removing or installing these strips.
2. With a small screwdriver, gently slide the blade between the terminal strip and protective label.
3. Slightly pry first one end, then the other, and then the middle. Repeat the process until the terminal strip can be removed straight off the circuit board by hand. Be very careful to not damage circuit board traces.
4. When re-installing the terminal strips, press down straight and evenly. Do not remove or install one end first. This will bend pins on the circuit board, which will damage the terminal strip internally. This damage is permanent and can not be repaired by simply straightening the pins on the circuit board.

✦ NOTE: Unscrew the terminal screws several turns before inserting wires.

Figure 1. RFI Filter Installation
**COMPONENT LOCATIONS**

1. **KEYPAD**
   - Die-cast metal 12-key keypad with tactile action. For system programming and keying in entry codes.

2. **DOWNLIGHT**
   - Illuminates keypad and visitor operation buttons. The light can be programmed to operate dusk to dawn and adjusts its time depending on the system’s geographic location.

3. **OPTIONAL CCTV CAMERA**
   - Location for the optional Model RE-BWC1 CCTV camera. The camera views the keypad area and has infrared lighting for nighttime use.

4. **MICROPHONE**
   - The high-sensitivity microphone monitors sound at the keypad area for the entry system’s speakerphone.

5. **CALL BUTTON**
   - Pressing this button causes the system to call the residence telephones with a distinctive ring signal.

6. **HELP BUTTON**
   - Pressing this button causes the system to play the help message to instruct the visitor on system use.

7. **SPEAKER**
   - Weatherproof speaker for system operation and programming.

8. **INTEGRAL ANTENNA**
   - Hidden antenna receives wireless radio signals from transmitters.

9. **OPTIONAL KEYLOCK**
   - Location for mounting access keylock. (MEDECO keylock with stainless steel cover shown).

10. **MAIN TERMINAL BLOCK**
    - For power, backup battery, sense inputs, open request inputs, and remote keypad connections.

11. **SPEAKERPHONE VOLUME CONTROL**
    - Controls the audio level produced by the speaker during communications between the visitor and the resident.

12. **RELAY TERMINAL BLOCK**
    - For Relay #1 and Relay #2 output connections to the access control devices.

13. **RELAY INDICATORS**
    - Indicators for Relay #1 and Relay #2 will light when the relay is activated.

14. **ANTENNA TERMINAL BLOCK**
    - For shield and center conductor connection of the coax cable from the system’s built-in radio antenna.

15. **LINE MONITOR JUMPER**
    - For testing and troubleshooting. Remove jumper to listen to telephone line audio through the speaker.

16. **DIGITAL SPEECH VOLUME CONTROL**
    - Controls the audio level of the voice synthesizer. This adjustment effects the audio level of the voice synthesizer and system tone from the speaker.

17. **STATUS INDICATORS**
    - Six indicators light to display system power, radio, and modem status.

18. **VIDEO CONNECTOR**
    - For cable connection to a video monitor. (Optional Model RE-BWC CCTV camera required).

19. **CAMERA CONNECTOR**
    - Provides power and video connection for the optional Model RE-BWC CCTV camera.

20. **RESTART BUTTON**
    - Pressing this button restarts the system. This button DOES NOT erase any programming data.

21. **TELEPHONE TERMINAL BLOCK**
    - For telephone line and earth ground connections.

MAXIMUM

RE-1 TELEPHONE ENTRY
SYSTEM

16 VAC 20 VA
TRANSFORMER
ENTRY SYSTEM MOUNTING

Pedestal Mounting
The RE-1 Entry System can be mounted on a standard pedestal.
1. Open the RE-1 case by removing the two security screws with the wrench provided (see Figure 2).
2. Use four security bolts and locking nuts to secure the backplate to the pedestal (see Figure 3).

Wall Mounting
The RE-1 Entry System can be mounted directly to a wall or flat surface.
1. Open the RE-1 case by removing the two security screws with the wrench provided (see Figure 2).
2. Use the appropriate fasteners to secure the system's backplate to the mounting surface. When mounting the system to a concrete wall, use concrete wedge anchors (see Figure 4).

TELEPHONE WIRING
The RE-1 connects between the incoming telephone line of the residence and local telephone sets.

Telephone Bypass Module
The RE-1’s Telephone Bypass Module provides surge protection and a switch to remove the RE-1 from the telephone line and re-connect the local telephones to the telephone system. **ALL TELEPHONE WIRING FOR THE RE-1 MUST PASS THROUGH THE BYPASS MODULE.**
The bypass module is housed in a weather-resistant enclosure and should be located in an area that is easily accessible to the resident. In case of system trouble, the resident can use the bypass switch to remove the RE-1 from the telephone system.

Telephone Wiring
- **DO NOT ROUTE TELEPHONE AND AC WIRING INSIDE THE SAME CONDUIT.** Route all telephone wires inside a dedicated conduit that is at least six inches away from any AC line wiring.
- All telephone wiring must be made on the “house” side of the telephone company’s demarcation device (the terminal block where the telephone line connects to the residence).
- If any security system or personal alert system at the residence is connected to the telephone line, be sure that it is connected to the line ahead of the Telephone Bypass Module using an RJ-31X or RJ-38X interface.
- Use only high-quality telephone wire rated for direct underground burial. All telephone wire should be twisted-pair with a minimum size of 24 AWG.

Typical Telephone Wiring
1. Connect the bypass module’s EARTH GROUND terminal to a good earth ground.
2. Before connecting the incoming telephone line to the bypass module check the polarity of the wires with a DC voltmeter. Connect the negative wire (RING - usually green) to the bypass module TELCO RING terminal. Connect the positive wire (TIP - usually red) to the bypass module TELCO TIP terminal.
3. Connect the resident's local telephone line RING (usually green) to the bypass module HOUSE RING. Connect the local telephone line TIP (usually red) to the bypass module HOUSE TIP terminal.
4. Connect the RE-1 TELCO RING to the bypass module RE-1 TELCO RING terminal. Connect the RE-1 TELCO TIP to the bypass module RE-1 TELCO TIP terminal.
5. Connect the RE-1 HOUSE RING to the bypass module RE-1 HOUSE RING terminal. Connect the RE-1 HOUSE TIP to the bypass module RE-1 HOUSE TIP terminal.

![Figure 2. Opening the RE-1 Case](image2.png)

![Figure 3. Pedestal Mounting Backplate](image3.png)

![Figure 4. Wall Mounting Backplate](image4.png)

![Figure 5. Telephone Wiring](image5.png)
**TELEPHONE WIRING OPTIONS**

**Shared Line**
This is the standard configuration. The telephone line is routed through the RE-1 to the house phones. Pressing the Call button on the RE-1 will cause the RE-1 to disconnect the house phones from the telephone company line and generate a ring signal that is heard on the house phones.

**Dedicated Line**
Pressing the Call button on the RE-1 will cause the RE-1 to seize the phone line and dial out to an outside number.

See PPN #54 for programming options.

**Intercom Mode**
Pressing the Call button on the RE-1 will cause the RE-1 to generate a ring signal as if it were an intercom station. A live phone line is not used and the RE-1 provides power for the remote intercom phone.

✦ **NOTE:** In this mode, remote programming, call forwarding, or alternate resident calling is not available.

See PPN #52 for programming options.

**Ring Down Mode**
Pressing the Call button on the RE-1 will cause the RE-1 to seize the phone line and provide immediate communications with the PBX system.

See PPN #54 for programming options.
Multiple Unit Installations

Any of the four basic operation modes (Shared Line, Dedicated Line, Intercom, and Ring Down) may be used with multiple RE-1s in the same installation. The telephone line wiring is “daisy chained” (the telephone line routes through one unit to the next) as shown below. Always connect the telephone line + to TIP, and - to RING.

The Telephone Bypass Module only performs the bypass function in the Shared Line Mode, but it will provide extra electrical surge protection in all modes. A surge on the TELCO terminals will be suppressed through the EARTH GROUND terminal. Always use separate AC transformers to power each RE-1.

When multiple units are connected together, only two units can be controlled by resident telephone commands, and only one unit can be programmed to answer the telephone (PPN #33) for remote telephone commands. Remote programming via computer is not supported when using multiple RE-1s.

Command Prefix for Multiple Units

Programming and relay control may be through the individual RE-1 keypads or through the house telephone(s) when using the Shared Line or Intercom Modes. To support using the house telephone(s) to issue commands, each RE-1 must be programmed to a different “command prefix” (PPN #72).

- Set one unit’s command prefix to 🔄 ✓
- Set the other unit’s command prefix to 🔄 ✗

In the case of simultaneous visitors at different units when using the Shared Line Mode, putting one RE-1 “on hold” to communicate with the second RE-1, then returning to the first RE-1 is not recommended. Instead, finish all communications with the first RE-1 before servicing the second RE-1. Simultaneous visitors at multiple units used on a single line wired in the Ring Down Mode will cause a “conference call” effect between units.

Figure 10. Multiple Unit Wiring
**CONTROL WIRING**

**Gate Control**

1. Route two wires between the gate and the RE-1. Connect the gate operator's OPEN terminals to the RE-1 Relay #1 COM & N.O. terminals.

   ✦ **NOTE:** For operator wiring specifics, refer to the gate operator's wiring diagram.

2. If an access keyswitch is required refer to the Optional Keyswitch section of this manual for details on keyswitch wiring and installation.

3. If an external timer for preventing access at certain times is required, route two wires from the RE-1 to the timer contacts. Connect the timer contacts to the RE-1 SENSE #1 and COMMON terminals.

   ✦ **NOTE:** If the sense input is going to be used as an inhibit input, it must be programmed to select that input type. See programming PPN #29.

**Door or Pedestrian Gate Control**

1. Install a low voltage electric door strike or magnetic lock as a locking device for the door or pedestrian gate.

2. Install the power supply or transformer for the locking device. **DO NOT POWER THE RE-1 FROM THIS POWER SUPPLY.**

3. Connect one wire from the power supply to one wire from the locking device.

4. Route two wires between the locking device and the RE-1. Connect one wire to the remaining wire of the locking device. Connect the other wire to the remaining wire of the power supply.

   ✦ For a door strike, connect the wires to the RE-1 Relay #1 COM & N.O.

   ✦ For a magnetic lock, connect the wires to the RE-1 Relay #1 COM & N.C.

5. If an access keyswitch is required refer to the Optional Keyswitch section of this manual for details on keyswitch wiring and installation.

6. To use the door sense feature to detect forced entry or door ajar conditions, install a normally closed door switch on the door or pedestrian gate and route two wires from the switch to the RE-1. Connect the door sense switch to the RE-1 SENSE #1 and COMMON terminals. See programming PPN #24 & #27 to define when Relay #2 will activate based on the sense input.

---

**Figure 11. Gate Installation Example**

**Figure 12. Gate Installation Wiring**

**Figure 13. Door Installation Example**

**Figure 14. Door Installation Wiring**
POWER, BATTERY, & GROUND WIRING

Power Wiring

+ **NOTE:** DO NOT APPLY POWER UNTIL THE INSTALLATION IS COMPLETE.

1. Route two wires between the RE-1 and the power transformer.
   - For power wire runs up to 100 feet, use 18 AWG, THHN 600-volt insulated wire.
   - For power wire runs up to 200 feet, use 16 AWG, THHN 600-volt insulated wire.
2. Connect the wires to the transformer. Connect the other end of the wires to the two RE-1 TERMINALS.

Backup Battery

Use of battery backup is optional. It will allow the RE-1 to operate for short periods of time without AC power. Two 12-volt backup batteries in series are recommended to obtain the proper working voltage for the RE-1. A single 12-volt battery can be used, although the call waiting beeps and the ring voltage will be lower than normal when five telephones are connected. The door or gate access device must use some type of battery backup for the entire system to be functional.

Backup batteries will not fit into the RE-1 housing. Protect the backup batteries inside a rain-tight NEMA enclosure suitable for the installation.

+ **NOTE:** Backup batteries are not required to maintain the RE-1 clock/calendar and programming memory during power outages.

1. Route two wires between the RE-1 and the backup batteries.
2. Connect two 1.2 Amp/hour (minimum), 12-volt, gel cell batteries in series (Battery #1 negative to Battery #2 positive).
3. Connect the Battery #1 positive to the RE-1.
4. Connect the Battery #2 negative to the RE-1.
5. **NOTE:** The RE-1 does not supply battery charging current. An external battery charger will be required to maintain the batteries.

Earth Ground

For the best ground, use size 12 gauge solid wire or larger to connect the to an 8-foot copper ground rod. Locate the ground rod next to the Power and Telephone company rods and bond the rods together with a new clamp. Do not disturb the clamps installed by the Power or Telephone Company. Alternately, connect to a cold water pipe for the earth ground.

1. Connect the RE-1 EARTH terminal to the earth ground wire.
2. Connect the Telephone Bypass Module EARTH GROUND terminal to the earth ground wire.

---

OPTIONAL REMOTE KEYPAD

The optional Model AM-KP remote keypad can be used with the RE-1 entry system. A typical application for the remote keypad would be to control a second door or gate. Entry codes are the only method of access allowed at a remote keypad. The default system setting will cause the remote keypad to activate Relay #2.

1. Mount the AM-KP keypad onto a pedestal or to a wall.
2. Route 6-conductor cable from the RE-1 to the AM-KP.
   - For wire runs up to 300 feet use 24 AWG Belden Type 9931 or equivalent.
   - For wire runs up to 600 feet use 20 AWG Weico Type 9405 or equivalent.
3. Set the DEVICE ADDRESS rotary switch in the AM-KP to match the remote keypad address in the RE-1 (default = 3).
4. Connect the 6-conductor cable as shown in Figure 17.
5. Secure and lock the AM-KP to its mounting plate.

---

**Figure 15. Power, Backup Battery & Ground Wiring**

**Figure 16. Setting the Keypad Device Address**

**Figure 17. Remote Keypad Wiring**
**OPTIONAL KEYSWITCH**

A keyswitch can be installed in the RE-1 Entry System to provide keyed access. The RE-1 case is designed to accept the following keyswitch:

**KNOX COMPANY MODEL 3501**  
KNOX COMPANY  
800-552-5669  
www.knoxbox.com

**Keyswitch Installation**

1. Disconnect the wiring harness connector and remove the antenna terminal block. Remove the four circuit board retaining screws and the RE-1 circuit board (see Figure 18).
2. Remove the screw and washer that retain the keyswitch hole access plate (see Figure 19).
3. Hold the lock cover and plastic spacer in place on the RE-1 case. Secure the assembly with four screws, lock washers, and nuts. Slide the keyswitch into the hole, oriented as shown (see Figure 20). Secure the keyswitch with the large switch nut. Use bolt cutters to trim the two screws closest to the case edge so they will clear the circuit board (see Figure 21).
4. Plug the two keyswitch snap-on wire leads (supplied with the switch) onto the keyswitch COM and N.O. pins (see Figure 21).
5. Replace the RE-1 circuit board. Secure the board with the four screws. Reconnect the antenna terminal block and wiring harness connector.
6. Connect one keyswitch wire to the RE-1 OPEN #1 terminal. Connect the other keyswitch wire to the RE-1 COMMON terminal.

---

**Figure 18. Removing the RE-1 Circuit Board**

**Figure 19. Removing the Keyswitch Hole Access Plate**

**Figure 20. Installing the Keyswitch**

**Figure 21. Keyswitch Wire Connections**

**Figure 22. Keyswitch Wiring**
**OPTIONAL CCTV CAMERA**

Linear’s Model RE-BWC1 (P/N ACP00886A) CCTV camera can be installed inside the RE-1 Entry System. The camera provides a video signal for viewing the area in front of the entry system.

The camera is continuously powered by the RE-1. The camera’s infrared light emitters illuminate the area directly in front of the entry system for nighttime or low light operation.

The RE-1 **CAMERA** jack is used to connect the camera to the main circuit board with the double-ended modular cable supplied with the camera. This cable routes power to, and video from the camera.

The RE-1 **VIDEO** jack is for connection to a video cable with a Type “BNC” connector. Up to 300 feet of 75-ohm RG-59 video cable can be used. Longer cable runs may require the use of a video amplifier.

**Camera Installation**

1. Disconnect the wiring harness connector and remove the antenna terminal block. Remove the four circuit board retaining screws and the RE-1 circuit board (see Figure 23).
2. Mount the camera assembly into the RE-1 case. Secure the camera with the two screws provided (see Figure 24).
3. Connect the wiring harness 2-pin lighting power wiring connector onto the camera’s infrared lighting power connector (see Figure 25).
4. Replace the RE-1 circuit board. Secure the board with the four screws. Reconnect the antenna terminal block and wiring harness connector.
5. Plug the double-ended modular cable into camera’s jack and the RE-1 **CAMERA** jack (see Figure 26).
6. Connect the video cable to the RE-1 **VIDEO** connector (see Figure 27).

**Figure 23. Removing the RE-1 Circuit Board**

**Figure 24. Mounting the Camera in the RE-1**

**Figure 25. Connecting the Camera’s Lighting Power**

**Figure 26. Connecting the Camera Cable**

**Figure 27. Connecting the Video Cable**

**IMPORTANT!**

To prevent internal infrared light from entering the camera, be sure the foam gasket around the camera’s lens presses firmly against the RE-1’s faceplate.
PROGRAMMING ACCESS

The RE-1 can be programmed locally or remotely. The system’s built-in programming software can be accessed on-site or off-site using a computer with any Internet browser.

Without a computer, the RE-1 can be programmed from its main keypad, from any local TouchTone® telephone connected to the same line, or from any remote TouchTone® telephone by calling the unit. To guide you through the programming, the RE-1’s voice synthesizer will announce programming prompts over the telephone.

Programming with a Computer

Navigating through the RE-1’s programming “pages” is similar to browsing through your favorite web site’s pages. Anyone familiar with the Internet will find programming the RE-1 with a computer very easy. The RE-1’s memory contains the “pages” that the computer will view. When selections and changes are made on the computer, the RE-1’s memory is programmed to your custom settings.

System Requirements

✦ NOTE: These requirements are for a PC running the Windows™ operating system. For other types of computers and operating systems call Linear Technical Services for assistance.

1. A dial-up modem must be installed.
2. Dial-up networking must be installed.
3. An internet browser must be installed.

Windows98™ Setup (SEE NEXT PAGES FOR WINDOWS XP™ AND WINDOWS VISTA™ SETUP)

Creating a Local Computer Dial-up Connection

1. From “My Computer” select “Dial-up Networking” and select “Make New Connection”.
2. Name the connection “Local RE-1” and verify that the installed modem is listed as the device then select “Next”.
3. For the telephone number enter “###”, select “Next”, then select “Finish”.

✦ NOTE: The “###” prefix to access programming is the default value for the RE-1. It can be changed in the RE-1 using PPN #72. Be sure the prefix entered as the telephone number matches what has been set in the RE-1 if it has been changed from the default.

4. Right-click on “Local RE-1” and select “Properties”.
5. From the “General” tab, in the “Connect Using” area, select “Configure...”.
6. From the “General” tab, in the “Speaker volume area”, set the volume to “High”.
7. Select the “Connection” tab.
8. Select “Advanced...”.
9. In the “Use error control” area, de-select “Compress data” and select “OK".
10. Select "OK" again.
11. Select the “Server Types” or “Networking” tab.
12. In the “Advanced Options” area, de-select “Enable software compression”.
13. In the “Allowed network protocols” area, de-select “NetBEUI” and de-select “IPX/SPX Compatible”. Only “TCP/IP” should be selected.
14. Select “TCP/IP Settings...”.
15. Select “Specify an IP address”.
16. Enter “192.168.20.11” as the “IP address”.
17. De-select “Use IP header compression” and de-select “Use default gateway on remote network” then select “OK”.
18. Select “OK” again to complete the properties settings.

Connecting Remotely

1. Start your browser software. If your browser is set to automatically dial your normal Internet provider when the browser is opened, cancel the dialing when it starts.
2. From “My Computer” select “Dial-up networking”.
3. Double-click on “Remote RE-1”. (The Remote RE-1 icon can be dragged to the desktop for easy future access).
4. Enter the RE-1’s programming master password (123456, unless changed) into the “Password” area. Select “Save Password” if you want the computer to retain the password.
5. Select “Connect” and wait for the modem to connect to the RE-1.
6. Switch to the browser software and enter into the address line: “http://192.168.20.10/re1.html” (save this address as a “favorite” or “bookmark” so you won’t have to enter it each time you connect).
7. Follow the screen links to select the RE-1 items to program.
8. When finished programming, double-click on the dial-up networking icon in the status area of the task bar and select “Disconnect” to terminate the connection.

✦ NOTE: Be sure to disconnect when programming is completed.

Creating Remote Computer Dial-up Connection

1. From “My Computer” select “Dial-up Networking” and select “Make New Connection”.
2. Name the connection “Remote RE-1” and verify that the installed modem is listed as the device the select “Next”.
3. For the telephone number enter the telephone number of the line that the RE-1 is installed on, select “Next”, then select “Finish”.
4. Right-click on “Remote RE-1” and select “Properties”.
5. From the “General” tab, in the “Connect Using” area, select “Configure...”.
6. From the “General” tab, in the “Speaker volume area”, set the volume to “High”.
7. Select the “Connection” tab.
8. Select “Advanced...”.
9. In the “Use error control” area, de-select “Compress data” and select “OK”. Select “OK”.
10. Select “OK” again.
11. Select the “Server Types” or “Networking” tab.
12. In the “Advanced Options” area, de-select “Enable software compression”.
13. In the “Allowed network protocols” area, de-select “NetBEUI” and de-select “IPX/SPX Compatible”. Only “TCP/IP” should be selected.
14. Select “TCP/IP Settings...”.
15. Select “Specify an IP address”.
16. Enter “192.168.20.11” as the “IP address”.
17. De-select “Use IP header compression” and de-select “Use default gateway on remote network” then select “OK”.
18. Select “OK” again to complete the properties settings.

Connecting Locally

1. Start your browser software. If your browser is set to automatically dial your normal Internet provider when the browser is opened, cancel the dialing when it starts.
2. Start “Dial-up networking”.
3. Double-click on “Local RE-1”. (The Local RE-1 icon can be dragged to the desktop for easy future access).
4. Enter the RE-1’s programming master password (123456, unless changed) into the “Password” area. Select “Save Password” if you want the computer to retain the password.
5. Select “Connect” and wait for the modem to connect to the RE-1.
6. Switch to the browser software and enter into the address line: “http://192.168.20.10/re1.html” (save this address as a “favorite” or “bookmark” so you won’t have to enter it each time you connect).
7. Follow the screen links to select the RE-1 items to program.
8. When finished programming, double-click on the dial-up networking icon in the status area of the task bar and select “Disconnect” to terminate the connection.

✦ NOTE: Be sure to disconnect when programming is completed.

1. FROM CONTROL PANEL SELECT "NETWORK CONNECTIONS" THEN SELECT "NEW CONNECTION WIZARD"

2. THE NEW CONNECTION WIZARD WILL START CLICK "NEXT"

3. NEW CONNECTION WIZARD - "NETWORK CONNECTION TYPE" SELECT "CONNECT TO THE INTERNET" OPTION

4. NEW CONNECTION WIZARD - "GETTING READY" SELECT "SET UP MY CONNECTION MANUALLY"

5. NEW CONNECTION WIZARD - "INTERNET CONNECTION" SELECT "CONNECT USING DIAL UP MODEM"

6. NEW CONNECTION WIZARD - "PHONE NUMBER TO DIAL" FOR A REMOTE CONNECTION, ENTER THE PHONE NUMBER OF THE RE-1'S PHONE LINE, FOR A LOCAL CONNECTION ENTER "###" (THE DEFAULT LOCAL ACCESS PASSWORD)

7. NEW CONNECTION WIZARD - "PHONE NUMBER TO DIAL" FOR A REMOTE CONNECTION, ENTER THE PHONE NUMBER OF THE RE-1'S PHONE LINE, FOR A LOCAL CONNECTION ENTER "###" (THE DEFAULT LOCAL ACCESS PASSWORD)

8. NEW CONNECTION WIZARD - "INTERNET ACCOUNT INFORMATION" ENTER "Linear" AS USER NAME AND "123456" AS PASSWORD

9. NEW CONNECTION WIZARD - "INTERNET ACCOUNT INFORMATION" ENTER "Linear" AS USER NAME AND "123456" AS PASSWORD

10. DOUBLE-CLICK ON DESKTOP ICON TO LAUNCH THE CONNECTION WINDOW

11. CLICK "PROPERTIES" TO SET OPTIONS

12. SELECT "NETWORKING" TAB, THEN CLICK PROPERTIES FOR "INTERNET PROTOCOL (TCP/IP)"

13. SELECT "USE THE FOLLOWING IP ADDRESS" AND ENTER 192.168.20.11 THEN CLICK "ADVANCED..."

14. UN-CHECK "USE DEFAULT GATEWAY ON REMOTE NETWORK" AND UN-CHECK "USE IP HEADER COMPRESSION" THEN CLICK OK
1. Double-click on desktop icon to launch the connection window.

2. Click "Dial" to start the connection.

3. The modem will dial the number.

4. Only when connecting remotely, after three rings, click "Cancel", wait 10 seconds, then repeat steps 1-3. The RE-1 will answer the phone on the second call attempt.

5. The RE-1 will verify the username and password.

6. After connecting, switch to your Microsoft Internet Explorer browser software and enter this address:

   http://192.168.20.10/re1.html
1. From the start menu, click on "Connect to"

2. Click on "Setup a connection or network"

3. Choose "Set up a dial-up connection"

4. Click on the modem to be used for the connection

5. Fill in the information for the connection

6. Click on "Set up the connection anyway"
7. CLICK ON "CLOSE"

8. FROM THE START MENU, CLICK ON "CONNECT TO" AND SELECT "RE-1"

9. IN THE CONNECT WINDOW, SELECT "PROPERTIES"

10. CLICK ON "CONFIGURE" AND UN-CHECK ALL HARDWARE FEATURES

11. CLICK ON "OK" THEN CLICK ON "NETWORKING" TAB, HIGHLIGHT "INTERNET PROTOCOL VERSION 4 (TCP/IPv4)" AND CLICK ON "PROPERTIES"

12. CLICK ON "USE THE FOLLOWING IP ADDRESS" AND ENTER 192.168.20.11

13. CLICK ON "ADVANCED" AND UN-CHECK "USE IP HEADER COMPRESSION"
1. Click on "Dial" start the connection

2. The modem will dial the number

3. Only when connecting remotely, after three rings, click "Cancel", wait 10 seconds then repeat steps 1-3. The RE-1 will answer the phone on the second call attempt

4. The RE-1 will verify the username and password

5. After connecting, switch to your Microsoft Internet Explorer browser software and enter this address:
   http://192.168.20.10/re1.html
LOCAL PROGRAMMING ACCESS

Programming with a Local Telephone or the Unit’s Keypad

Start with Step 1 below for local programming with the unit’s keypad or a local telephone.

1. Enter “###” (unless the programming prefix has been changed) then the Master Programming Code (123456, unless it has been changed), then “#”.
2. Use the telephone keys or keypad to make any programming changes. Refer to the next section for details of the keystrokes for each programming PPN. The voice synthesizer will sound programming prompts.
3. To disconnect after programming, enter “99#”.

✦ NOTE: The RE-1 will automatically exit programming mode after five minutes of no programming activity.

REMOTE PROGRAMMING ACCESS

Remote Programming with a Telephone

For remote programming, the RE-1 can be called from any TouchTone® telephone. Once the connection is made, the programming keystrokes are identical to what would be entered at the unit’s keypad or from a local telephone. Refer to the next section for details of the keystrokes for each programming PPN.

Remote Telephone Connection

1. Dial the telephone number of the line that the RE-1 is connected to.
2. Let the telephone ring twice and hang up.
3. After 10 seconds, but before 30 seconds, call back to the same telephone number.
4. The RE-1 will answer and sound a tone for 2 seconds.
5. The RE-1 will wait for approximately six seconds for the caller to enter the Master Programming Code.
6. Enter password (123456, unless it has been changed), then “#”.
7. Use the telephone keypad to make any programming changes. Refer to the next section for details of the keystrokes for each programming PPN. The voice synthesizer will sound programming prompts.
8. To disconnect after programming, enter “99#”.

**MASTER CODE**

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
**BASIC SYSTEM PROGRAMMING**

**Entering Programming Mode**

The 6-digit Master Programming Code (default = 123456) is used to enter Programming Mode from a local or remote telephone or the keypad.

Press: Master Code

Master Code = the current 6-digit Master Programming Code

**Exiting Programming Mode**

Press: 99

✦ NOTE: The RE-1 will automatically exit Programming Mode after five minutes of programming inactivity.

**Changing the Master Code**

Use this PPN to change the six-digit Master Programming Code. Be sure to write down the new code.

Press: 93 New Master Code

**Setting the Clock And Calendar**

The time and date set in the clock and calendar control the system time zones, holiday schedules, and time stamping of the event log. The GTZ setting controls when the downlight is on. The RE-1 has an on-board lithium battery to maintain the date and time if power is removed from the unit.

Press: 20 Day of Week Month Day

Year Hour Minute AM/PM GTZ

Day of Week: 1 = Sun; 2 = Mon; 3 = Tue; 4 = Wed; 5 = Thu; 6 = Fri; 7 = Sat

Month = 1-12; Day = 1-31; Year = 2000-2127;

Hour = 1-12 (in standard, non-daylight saving time)

Minute = 0-59; AM/PM: 0 = AM; 1 = PM

GTZ (Geographic Time Zone): 0 = None (disables nighttime keypad lighting); 1 = Eastern; 2 = Central; 3 = Mountain; 4 = Pacific; 5 = Alaska; 6 = Hawaii

**Setting the Time Zones**

Seven time zones are available for restricting access, automatic gate entry, call forwarding schedule, assigning an access group for transmitters, assigning a temporary entry code, and setting the "Do Not Disturb" schedule. A time zone constrained event will be allowed or occur between the start and end times on the active days selected.

Press: 10 Time Zone Number Active Days

Start Hour Start Minute AM/PM End Hour

End Minute AM/PM

Time Zone Number = 1-7

Active Days (Enter up to 8 digits): 1 = Sun; 2 = Mon; 3 = Tue; 4 = Wed; 5 = Thu; 6 = Fri; 7 = Sat; 8 = Holidays

Start Hour = 1-12

Start Minute = 0-59

AM/PM: 0 = AM; 1 = PM

End Hour = 1-12

End Minute = 0-59

AM/PM: 0 = AM; 1 = PM

**Setting the Holiday Days**

Up to ten holidays can be programmed. Holidays are used to restrict access on holiday days. If an entry method (code or transmitter) is assigned to a time zone, holidays must be set as an active day to allow access on holidays.

Press: 12 Holiday Number Month Day

Holiday Number = 1-10

Month = 1-12

Day = 1-31

**ENTRY CODE PROGRAMMING**

**Setting the Entry Code Length**

Sets the number of digits for all the entry codes programmed.

Press: Length

Length = 2 - 6 for entry code length

✦ NOTE: If the Entry Code Length is going to be changed from the factory default of four digits, make this change first, before programming any entry codes.

**Adding a New Entry Code**

Use this PPN to add up to 100 entry codes.

Time Zone

Code = The new entry code: 1-999999, depending on code length

Relay = Relay that entry code will activate:

1 = Relay #1    2 = Relay #2    3 = Both Relays

4 = Latch Relay #1 (no access restrictions, latches relay, un latch relay by re-entering code)

Time Zone = 0 = no time zone; 1-7 to restrict access per time zone 1-7

Valid From = First date (MMDDYY) that the entry code is valid

Valid Thru = Last date (MMDDYY) the entry code is valid

Number = Number of times (1-255) that the entry code is allowed access

**Adding a Temporary Entry Code**

Temporary entry codes with a starting and ending date can be created to permit limited access. Temporary entry codes will expire and no longer be able to grant access outside the programmed dates and a programmed number of uses. The total number of temporary and regular entry codes cannot exceed 100.

Number Valid From Valid Thru

Code = The new entry code: 1-999999, depending on code length

Relay = Relay that entry code will activate:

1 = Relay #1    2 = Relay #2    3 = Both Relays

Time Zone = 0 = no time zone; 1-7 to restrict access per time zone 1-7

Valid From = First date (MMDDYY) that the entry code is valid

Valid Thru = Last date (MMDDYY) the entry code is valid

**Removing a Single Entry Code**

Use this PPN to delete an entry code.

**Erasing All Entry Codes**

★ WARNING: This command will remove all entry codes.

Press: 97 000000 000000
TRANSMITTER PROGRAMMING

Adding Transmitters
Up to 24 groups of transmitters can be assigned common access privileges sharing the same one or two time zones. Up to 100 transmitters total in all groups combined can be used in each RE-1 system.

Time Zone 1 Time Zone 2
Number = Number of transmitters in the group
Facility Code = Facility code 0-15 marked on block of transmitters;
First ID = 5-digit ID number of first transmitter in group.
Time Zone 1 0 = no time zone; 1-7 to restrict access per time zone 1-7
Time Zone 2 0 = no time zone; 1-7 to restrict access per time zone 1-7

NOTE: If the Time Zone 1 entry is set to "0", the Time Zone 2 entry is ignored.

Suspend or Activate a Transmitter
Each transmitter programmed can be individually suspended from use for access with this programming PPN. The transmitter will remain suspended until it is re-activated using this same programming PPN.
Press: 5 [Facility ID Action]
Facility = Facility code 0-15 of transmitter
ID = 5-digit ID number of transmitter
Action: 0 = Suspend transmitter; 1 = Re-activate transmitter

Erasing All Transmitters
★ WARNING: Performing this command will remove all transmitters from the memory.
Press: 9 [000000 000000]

Assigning Transmitter Buttons to Relays

Press: 8 [Button Relay]
Button: 1 = Right (or Top Right); 2 = Left (or Top Left)
4 = Top; 5 = Bottom Right; 6 = Bottom Left
Relay: 0 = None; 1 = Relay #1; 2 = Relay #2; 3 = Both Relays

TELEPHONE PROGRAMMING

Maximum Number of Visitor Rings Default: 5 Rings
Changes the maximum number of distinctive rings that the RE-1 will generate to the local telephones when the CALL button is pressed.
Rings = 1-15 Rings maximum

Call Forwarding Dialing Method Default: Tone
Sets the dialing method used during call forwarding to either tone or pulse style.
Method: 1 = Pulse; 2 = Tone

Visitor Talk Time Limit Default: 60 Seconds
Sets the time that the visitor is allowed to talk to the resident. Ten seconds before the time expires, the voice synthesizer will announce "ten seconds", and at five seconds it will announce "five seconds", to the visitor. If the voice synthesizer is disabled (PPN #44), a beep will sound each second during the last ten seconds of time allowed.
Limit = 15-255 Seconds allowed

Call Waiting Feature On/Off Default: On
Turns the call waiting feature on or off. If call waiting is on (factory default) and the resident is on the telephone at the same time a visitor calls, the RE-1 will generate beeps on the resident's telephone line to signal that a visitor is calling. The resident has the option to switch to the visitor's call. If the call waiting feature is off and the resident is on the telephone at the same time a visitor calls, the RE-1 will announce "visitor busy" to the visitor.
Press: 5 [Call Waiting]
Call Waiting: 1 = ON; 0 = OFF

Privacy Feature Schedule Default: Off
The privacy feature will block visitor's calls and call forwarding during the selected Time Zone or at all times. If the privacy feature is active and a visitor calls, the RE-1 will announce "do not disturb resident". If call forwarding is scheduled (PPN #54) and the privacy feature is active, the RE-1 will announce "do not disturb resident", and visitor's call will not be forwarded.
Press: 5 [Privacy Time Zone]
Privacy: 0 = Privacy feature OFF
1 = Privacy feature ON (scheduled by Time Zone)
2 = Privacy feature ON at all times
Time Zone = 1-7 (Privacy feature active during this Time Zone)

Intercom Mode On/Off Default: Off
The RE-1 includes an Intercom Mode that allows the unit to be operated independent of the Public Switched Network. In this mode, the RE-1 directly supplies the power for the house telephone(s) connected to it.
To use the RE-1 in intercom mode, connect the telephone line as shown under Telephone Wiring Options on Page 6. Note that the RE-1's Telephone Bypass Module is included in the circuit for additional telephone line surge protection. Be sure the Telephone Bypass Module's switch is in the NORMAL position.

NOTE: Because there is no connection to the Public Switched Telephone Network, the call forwarding and alternate resident telephone dialing features will not be available.
This programming step turns the intercom mode on or off. If intercom mode is on, the RE-1 will power the house telephone(s).
If intercom mode is off, the Telephone Company will power the house telephone(s).
Intercom Mode: 1 = ON; 0 = OFF
Call Forwarding Feature Default: OFF

The call forwarding feature will allow a visitor to contact the resident at the programmed telephone number instead of through the local telephone line. The feature can be set to be active during a selected Time Zone or at all times. The telephone number programmed can contain an extension number and an optional time delay before dialing the extension.

Press: 5 4 3 Forwarding 4 Time Zone 4 Extension 4 Delay 4 Telephone Number 4 Extension 4 Delay 4

Forwarding: 0 = Call forwarding feature OFF
1 = Call forwarding feature ON at all times
2 = Call forwarding feature ON (scheduled by Time Zone)
3 = Forward the call if there was no resident answer

Time Zone = 1-7 (Call forwarding feature active during this Time Zone)
Telephone Number = Up to 11-digit telephone number
Extension = Up to 4-digit telephone extension number
Delay = 1-25 seconds (delay between telephone number and extension)

Example, call forwarding with only a phone number:
Press: 5 4 1 or 3 4 2 Telephone Number 4 Extension 4 Delay 4

Example, call forwarding with extension and no time zone:
Press: 5 4 3 1 or 3 4 4 Telephone Number 4 Extension 4 Delay 4

Example, call forwarding scheduled by time zone:
Press: 5 4 2 2 Time Zone 4 Telephone Number 4 Extension 4 Delay 4

NOTE: Time zone is only used with forwarding = 2

Example, call forwarding off:
Press: 5 4 0 0

Alternate Resident Telephone Numbers Default: All Disabled

For installations where multiple residences exist behind shared controlled access, the RE-1 can dial three alternate telephone numbers. The visitor can call an alternate number by entering “1#”, “2#”, or “3#” on the main keypad.

Press: 5 3 4 Location 4 Enable 4

Location: 1 = “1#” location; 2 = “2#” location; 3 = “3#” location
Enable: 0 = Disable; 1 = Unconditionally enable
Telephone Number: Up to 11-digit telephone number
Extension: Up to 4-digit telephone extension number
Delay: 1-25 seconds (delay between telephone number and extension)

Resident Response Telephone Keys

Key A “1” = Activates Relay #1
Key B “2” = Activates Relay #2
Key C “9” = Disconnect Visitor’s Call
Key D “6” = Switch To/From Call Waiting

The resident response keys are the telephone keys that the resident uses to grant access and control calls from a visitor. The keys for the four functions can be customized. Enter all four keys each time this programming PPN is used.

Press: 7 1 2 Keys ABCD 4

Keys ABCD: Enter 4 digits for the response keys A, B, C, & D

Example, call forwarding with only a phone number:
Press: 5 4 1 or 3 4 2 Telephone Number 4 Extension 4 Delay 4

Example, call forwarding with extension and no time zone:
Press: 5 4 3 1 or 3 4 4 Telephone Number 4 Extension 4 Delay 4

Example, call forwarding scheduled by time zone:
Press: 5 4 2 2 Time Zone 4 Telephone Number 4 Extension 4 Delay 4

NOTE: Time zone is only used with forwarding = 2
**Relay #2 Alternate Options**

Default: Access Relay

Relay #2 can be used for functions other than triggering a gate operator or door strike. Relay #2 can be programmed to shunt alarm contacts during Relay #1 activation or perform up to five Alarm Functions. Two PPN numbers are used to program the Relay #2 options.

Press: [2][7][Role]

Role: 0 = Access Relay
1 = Alarm Shunt (Follows Relay #1 activation, used to shunt external alarm contacts with Relay #2's contacts)
2 = Obstacle Detector
3 = Activate during one or more of the five Alarm Functions programmed below

✦ NOTE: More than one alarm function can be enabled at a time. Up to five digits can be entered for “Activate”.

Press: [2][4][Activate]

Activate: 0 = No alarm function (default)
1 = On forced entry (activates when SENSE #1 input opens without Relay #1 activation)
2 = On door/gate ajar (activates when SENSE #1 input stays open for longer than one minute after Relay #1 activation)
3 = On main keypad lockout (activates when the main keypad is in “lockout” from too many incorrect code attempts)
4 = On remote keypad lockout (activates when the remote keypad is in “lockout” from too many incorrect code attempts)
5 = On driveway sensor (activates when SENSE #2 input closes)

**Model MGT Gate Edge Transmitter Setup**

Linear’s Model MGT Gate Edge Transmitter can be used with the RE-1 for obstacle detection. When the gate edge sensor triggers the MGT transmitter, the RE-1 can be programmed to activate Relay #2 which would in turn, activate the obstacle input of the gate operator.

Press: [2][6][Obstacle][Facility][ID]

Obstacle: 0 = No MGT obstacle transmitter (default)
1 = MGT obstacle transmitter used
Facility: Facility code 0-15 of MGT transmitter
ID = 5-digit ID number of transmitter

✦ NOTE: The Facility and ID entries are not required if Obstacle is set to “0”.

**Remote Keypad Address**

Default: 3

If a Linear Model AM-KP is used as a remote keypad the ADDRESS switch in the remote keypad needs to match the “address” setting in the RE-1. For most installations, simply set the remote keypad’s ADDRESS switch to “3” to match the RE-1 default setting. If required, use the following programming PPN to change the address number.

Press: [2][8][Address]

Address: 0 = Remote keypad disabled
1-6 = Keypad address 1-6

✦ NOTE: After changing the keypad address, restart the system using the RESTART button.

**Sense Input Alternate Function**

Default: SENSE #1 = SENSE
SENSE #2 = SENSE

Each of the two SENSE inputs can be independently programmed to act as INHIBIT inputs. As an INHIBIT input, as long as the input is grounded, access can not be granted for that input’s relay (1 or 2). A typical application would be connection of an external timer or service switch to temporarily prevent visitors from activating the access device.

Press: [2][9][Input][Type]

Input: 1 = SENSE #1
2 = SENSE #2
Type: 0 = Input will perform as SENSE
1 = Input will perform as INHIBIT

**Keypad Lockout Count**

Default: 5 Tries

The Keypad Lockout Count sets the number of incorrect code entry attempts required to place the keypad in “lockout” for a one minute period. During “lockout” the keypad will not accept any code entries. The Keypad Lockout Count effects both the main and remote keypads.

Press: [3][0][Count]

Count = 2-7 Incorrect entries

**Anti-passback Time**

Default: Off

The Anti-passback feature prevents the same entry code or transmitter from being used to gain access more than once during the set time.

Press: [3][1][Time]

Time: 0 = No anti-passback
1-4 = Anti-passback time (in minutes)

**Modem Ring Detect On/Off**

Default: On

The RE-1’s built-in modem monitors the telephone line for telephone rings. When the Modem Ring Detect is enabled, the modem will answer the telephone if two consecutive telephone calls occur within 30 seconds. The Modem Ring Detect can be disabled, this will also disable any computer based programming of the RE-1.

Press: [3][2][Detect]

Detect: 0 = Ring detect OFF
1 = Ring detect ON
Keypad Beeps On/Off Default: On
The default setting causes the main keypad to beep when each key is pressed. The beeps can be disabled.
Press: Keypad Beeps
Keypad Beeps: 0 = Beeps OFF
1 = Beeps ON

Relay #1 Tone On/Off Default: Off
The default setting does not cause the annunciator to sound when Relay #1 is activated. The Relay #1 activation tone can be enabled.
Press: Relay #1 Tone
Relay #1 Tone: 0 = Tone OFF
1 = Tone ON

Relay #2 Tone On/Off Default: Off
The default setting does not cause the annunciator to sound when Relay #2 is activated. The Relay #2 activation tone can be enabled.
Press: Relay #2 Tone
Relay #2 Tone: 0 = Tone OFF
1 = Tone ON

Relay Tone Duration Default: 1 Second
The default setting causes the annunciator to sound for 1 second when Relay #1 or Relay #2 is activated (if the tones are enabled). The length of the activation annunciation can be changed.
Press: Tone Length
Tone Length = Tone length in Seconds 1-15

Voice Synthesizer On/Off Default: On
When the voice synthesizer is on the RE-1 will sound voice prompts during operation and programming. If the voice synthesizer is off, the system will sound beeps to indicate conditions. The HELP button will announce “Enter code or press call button to contact resident” regardless of this setting. The beeps produced when the voice synthesizer is off are:
• 1 Short beep — Keypad key pressed
• 2 Short beeps — Programming entry was valid
• 1 Long beep — Programming entry was invalid
Press: Voice
Voice: 0 = Voice synthesizer OFF
1 = Voice synthesizer ON

Automatic Daylight Saving Time Clock Adjustment On/Off Default: On
The RE-1s internal clock used for controlling system functions and time stamping of the event log automatically adjusts for daylight saving time. The time will change on the first Sunday in April, and on the last Sunday of October. For areas where daylight saving time is not observed, this feature may be disabled.
Press: Daylight Saving
Daylight Saving: 0 = Daylight Saving Adjust OFF
1 = Daylight Saving Adjust ON

Automatic Door/Gate Open Time Default: Not Set
Each control relay can be programmed for automatic activation. One or two Time Zones can be assigned to a relay. The relay will activate and remain latched during the active period of the Time Zone.
Press: Relay
Relay: 1 = Relay #1
2 = Relay #2
1st Time Zone = Time Zone 1-7
2nd Time Zone = Time Zone 1-7 (enter “0” if the 2nd time zone is not used)

SYSTEM ADJUSTMENTS
The RE-1 Entry System audio levels can be adjusted to suit the installation requirements. If required, make these adjustments after programming, but before closing and securing the RE-1 case.

Speakerphone Volume
The SPEAKERPHONE VOLUME adjustment controls the audio level that the RE-1 speaker produces during communications between the visitor and the resident.

NOTE: Adjusting the speaker volume too high will cause the speech to cut-out as the system switches from talk to listen.
1. Have someone waiting to receive the call. Push the CALL button to call the residence.
2. Have the resident talk at a normal volume level while adjusting the SPEAKERPHONE VOLUME control. Adjusting the control clockwise increases the volume, counterclockwise decreases the volume.

Digital Speech Volume
The DIGITAL SPEECH VOLUME adjustment controls the audio level of the voice synthesizer. This adjustment effects the audio level of the voice synthesizer from the speaker and through the telephone.
1. Push the HELP button to cause the voice synthesizer to sound the help message.
2. Adjust the DIGITAL SPEECH VOLUME to suit the installation. Adjusting the control clockwise increases the volume, counterclockwise decreases the volume.
**RE-1 OPERATION**

**Requesting Access with an Entry Code**
- Visitors have up to 40 seconds to key in their entry code.
- Up to eight seconds are allowed between each keystroke.
- All digits of the entry code must be entered. Example: If the code is 0042, the user must enter “0 0 4 2”.
- If the wrong key is pressed, pressing the *key will reset the keypad. The correct code can then be entered.
- After a correct code is entered, and if the conditions for granting access are fulfilled, the programmed relay will activate for the programmed time.
- If the number of incorrect codes entered exceeds the keypad lockout count, the keypad will be locked and not accept any entries for one minute.
- If the Anti-passback feature is enabled, the entry code will be unusable until the anti-passback time expires.

**Requesting Access with a Wireless Transmitter**
- Activate a wireless transmitter within radio range (up to 300 feet) of the RE-1.
- After a valid transmitter is decoded, and if the conditions for granting access are fulfilled, relay will activate for the programmed time.
- If the Anti-passback feature is enabled, the transmitter will be unusable until the anti-passback time expires.

**Requesting Access with a Visitor Call**
- The visitor presses the CALL button.
- The RE-1 disconnects the local telephones from the incoming telephone line and generates distinctive rings to the local telephones.
- The resident answers the call and converses with the visitor to determine if access will be granted.
- If the resident is using the telephone at the same time a visitor calls, and the Call Waiting feature is enabled, the RE-1 will sound beeps on the telephone line to notify that a visitor is calling. The resident can place the outside caller on hold and switch to (and from) the visitor by pressing 6 on the telephone.
- The resident can use the telephone’s keypad to grant access activating Relay #1 by pressing 1 or activating Relay #2 by pressing 2.
- The resident can disconnect the visitor without granting access by pressing 9 or by hanging up.
- If the Call Forwarding feature is enabled, the system will forward the visitor’s call to an outside telephone number during the programmed time for call forwarding. The resident can control access from the forwarded telephone number.
- The system can be programmed to produce a “Do Not Disturb” message for the visitor during times when privacy is desired. No call will be generated to the residence and access will be denied.
- Pressing the # key will cancel the call.

**NOTE:** The telephone control keys are programmable and can be changed (see PPN #71).

**Requesting Access with a Visitor Call to an Alternate Number**
- The system can be programmed to provide up to three alternate telephone numbers to dial for installations where multiple residences are secured by shared controlled access.
- The visitor can call the alternate telephone numbers by pressing: 1 or 3. The three numbers are defined by programming.

**Residence Telephone Commands**
- The system can be controlled by the resident without a call from a visitor by using any telephone connected to the local line.
- To activate and latch Relay #1 press $$ 3 1 $$
- To activate and latch Relay #2 press $$ 3 2 $$
- To release Relay #1 press $$ 3 3 $$
- To release Relay #2 press $$ 3 4 $$
- To begin voice communications with the RE-1 press $$ 3 5 $$

**NOTE:** The “##” command prefix is programmable and can be changed (see PPN #72).

**Obstacle Transmitter Supervision**
- If the Model MGT obstacle transmitter has a supervisory condition, a one-second beep will be heard on any telephone connected to the local line when the telephone is off-hook (dialing during this beep is not recommended).
- Servicing the MGT transmitter (replacing the batteries, correcting the tamper condition, etc.) will correct the supervisory condition and stop the one-second beeps.

**Remote Telephone Commands**
- The system can be operated from a remote phone.
  1. Dial the phone number for the RE-1. Wait two rings then hang up.
  2. Wait at least 10, but not longer than 30 seconds and re-dial the phone number for the RE-1.
  3. The RE-1 will answer. Wait for the modem tones to finish then enter your 6 digit password followed by #.
  4. The RE-1 will respond with “Entry OK”.
- To latch Relay #1 press $$ 1 $$
- To latch Relay #2 press $$ 2 $$
- To release Relay #1 press $$ 3 $$
- To release Relay #2 press $$ 4 $$
- The RE-1 will respond with “Entry OK”.
- To disconnect press $$ 9 9 $$

**Obstacle Transmitter Supervision**
- If the Model MGT obstacle transmitter has a supervisory condition, a one-second beep will be heard on any telephone connected to the local line when the telephone is off-hook (dialing during this beep is not recommended).
- Servicing the MGT transmitter (replacing the batteries, correcting the tamper condition, etc.) will correct the supervisory condition and stop the one-second beeps.
RESIDENT PROGRAMMING QUICK REFERENCE
Some of the programming PPN's may be commonly used by the resident. Following are quick references to the keystrokes required.

✦ NOTE: The "###" is the default command prefix. The following example assumes that the default has not been changed.

To Enter Programming Mode
Press: [Master Code]
Master Code = the current 6-digit Master Programming Code

To Exit Programming Mode & Save Changes
Press: [9 9]

Re-entering a Command After a Mistake
If an incorrect entry, or an incorrect key is pressed during programming, to clear the keypad:
Press: [Clear]

Adding a Entry Code
Press: [Code] [Code] [Code] [Relay] [Time Zone] [Code]
Code = The new entry code: 1-999999, depending on code length
Relay = Relay output entry code will activate:
1 = Relay #1  2 = Relay #2  3 = Both Relays
4 = Relay #1 as priority user (no access restrictions)
Time Zone = 0 = no time zone; 1-7 to restrict access per time zone 1-7

Adding a Temporary Entry code
Press: [Code] [Code] [Code] [Relay] [Time Zone] [Number]
Valid From [Valid Thru]
Code = The new entry code: 1-999999, depending on code length
Relay = Relay output entry code will activate:
1 = Relay #1  2 = Relay #2  3 = Both Relays
Time Zone = 0 = no time zone; 1-7 to restrict access per time zone 1-7
Number = Number of times (1-255) that the entry code is allowed access
Valid From = First date (MMDDYY) that the entry code is valid
Valid Thru = Last date (MMDDYY) the entry code is valid.

Removing a Single Entry Code
Press: [Code] [Code] [Code]
Code = The entry code to remove.

Suspend or Activate a Single Transmitter
Press: [Facility] [ID] [Action]
Facility = Facility code 1-16 of transmitter (0 = no facility code)
ID = 5-digit ID number of transmitter
Action: 0 = Suspend transmitter; 1 = Re-activate transmitter

Maximum Number of Visitor Rings
Press: [3 2] [Rings]
Rings = 1-15 Rings maximum

Visitor Talk Time Limit
Press: [4 5] [Limit]
Limit = 15-255 Seconds allowed

Call Forwarding
Press: [5 4] [Forwarding] [Time Zone] [Telephone Number]

Extension [Delay]
Forwarding: 0 = Call forwarding feature OFF
1 = Call forwarding feature ON at all times
2 = Call forwarding feature ON (scheduled by Time Zone)
Time Zone = 1-7 (Call forwarding feature active during this Time Zone)
Telephone Number = Up to 11-digit telephone number
Extension = Up to 4-digit telephone extension number
Delay = 1-25 seconds (delay between telephone number and extension)
Example:
Press: [3 4 1 1] [Telephone Number]

“Do Not Disturb” Privacy Feature On/Off
Press: [5 1] [Privacy] [Time Zone]
Privacy: 0 = Privacy feature OFF
1 = Privacy feature ON (scheduled by Time Zone)
2 = Privacy feature ON at all times
Time Zone = 1-7 (Privacy feature active during this Time Zone)

Automatic Door/Gate Open Time
Press: [5 3] [Relay] [1st Time Zone] [2nd Time Zone]
Relay: 1 = Relay #1
2 = Relay #2
1st Time Zone = Time Zone 1-7
2nd Time Zone = Time Zone 1-7 (enter “0” if the 2nd time zone is not used)

Setting Time Zones
Press: [1 0] [Time Zone Number] [Active Days] [Start Hour]
Start Minute [AM/PM] End Hour [End Minute] [AM/PM]
Time Zone Number = 1-7
Active Days (Enter up to 8 digits):
1 = Sun; 2 = Mon; 3 = Tue; 4 = Wed; 5 = Thu; 6 = Fri; 7 = Sat; 8 = Holidays
Start Hour = 1-12 Start Minute = 0-59 AM/PM: 0 = AM; 1 = PM
End Hour = 1-12 End Minute = 0-59 AM/PM: 0 = AM; 1 = PM

Setting the Holiday Days
Press: [1 2] [Holiday Number] [Month] [Day]
Holiday Number = 1-10
Month = 1-12
Day = 1-31
SPECIFICATIONS

MECHANICAL
Case dimensions: 6.45” W x 10.81” H x 3.74” D

ELECTRICAL
Voltage: 16 Volts AC or 12-24 Volts DC
Current: 650 mA AC typical, 1300 mA AC maximum
Backup Battery: Externally charged 12-24 Volt DC source
Backup Battery Current: with 12-volt backup battery
250 mA standby
600 mA ringing one phone
1100 mA maximum
with 24-volt backup battery
200 mA standby
350 mA ringing one phone
600 mA maximum
Outputs: Relay #1
Form “C” 3 Amps @ 30 Volts maximum
Relay #2
Form “C” 3 Amps @ 30 Volts maximum
Inputs: Two normally closed door sense/inhibit inputs
Two normally open request to exit inputs

RADIO
Frequency: 318 Mhz ± 500 KHz @ 23°C
RF 3db Bandwidth: 4 MHz Typical
Sensitivity: -97 dBm Minimum (-100 dBm Typical)
Encoding: Linear MegaCode® Format

ENVIRONMENTAL
Temperature: -22°F to 149°F (-30°C to 65°C)
Humidity: 5% to 95% non-condensing

DIMENSION DRAWING

TROUBLESHOOTING

System will not go into programming mode
1. Wrong master code entered.

System completely dead
1. No power from transformer. Check voltage at RE-1 transformer terminals.
2. Verify that terminal blocks are firmly plugged into circuit board.

Buzz on speaker
1. Check for 24 volt AC power shorted to wiring conduit.
2. Check for telephone line shorted to ground.
3. Verify that telephone wires are twisted pair.
4. Verify that the RE-1 and the Telephone Bypass Module are connected to earth ground.
5. Check 16 VAC voltage at RE-1 transformer terminals.

Buzz on telephone line
1. Switch the Telephone Bypass Module to bypass. Connect line ring and tip to house ring and tip. Check line for buzz with test set.
2. Disconnect 16 VAC wires from terminal strip, if buzz goes away, one side of the transformer wires is grounded.
3. Check all connections for any shorts to ground.

Telephones in residence will not ring
1. Verify that the “Do Not Disturb” feature is not on while testing.
2. Verify that the Call Forwarding feature is not forwarding the calls at the time.
3. Check 16 VAC voltage at RE-1 transformer terminals.
4. Disconnect the house telephone line and connect a test telephone to the RE-1 house ring and tip terminals. See if the test telephone rings.

System will not answer an incoming call
1. Modem ring detect (PPN #33) disabled.
2. Calling pattern incorrect. Let telephone ring once, hang up, wait 10-30 seconds, then call again.

Call forwarding feature is not working
1. Incorrect phone number has been programmed (PPN #54)
   ✦ NOTE: If you are programming the call forwarding feature as “on at all times”, no programming entry is needed for the time zone (see example in PPN #54).

Entry code will not activate relay
1. Entry code not set up for proper relay (PPN #2).
2. Time zone is active for the relay.

Remote keypad does not work
1. Remote keypad address is not enabled (PPN #28).
2. Remote keypad relay is not selected (PPN #23).

Main or remote keypad will not activate a relay
1. Keypad is not assigned to a relay (PPN #23).
2. Entry code is not assigned to correct relay (PPN #2).

Gate does not open/close at programmed time
1. Time was not entered as local time (PPN #20).
2. Auto Daylight Saving Time disabled in area that observes daylight saving (PPN #46).
3. Automatic Door/Gate time zone is not properly programmed (PPN #53).

Relay #1 will not latch from the keypad
1. Add an entry code with the relay programmed as a 4 (latch relay #1, PPN #2).

LINEAR LIMITED WARRANTY

This Linear product is warranted against defects in material and workmanship for twenty-four (24) months. The Warranty Expiration Date is labeled on the product. This warranty extends only to wholesale customers who buy direct from Linear or through Linear’s normal distribution channels. Linear does not warrant this product to consumers. Consumers should inquire from their selling dealer as to the nature of the dealer’s warranty, if any. There are no obligations or liabilities on the part of Linear LLC for consequential damages arising out of or in connection with use or performance of this product or other indirect damages with respect to loss of property, revenue, or profit, or cost of removal, installation, or reinstallation. All implied warranties, including implied warranties for merchantability and implied warranties for fitness, are valid only until Warranty Expiration Date as labeled on the product. This Linear LLC Warranty is in lieu of all other warranties express or implied.

All products returned for warranty service require a Return Product Authorization Number (RPA#). Contact Linear Technical Services at 1-800-421-1587 for an RPA# and other important details.

IMPORTANT WIRELESS INFORMATION

Linear radio controls provide a reliable communications link and fill an important need in portable wireless signaling. However, there are some limitations which must be observed.

• For U.S. installations only: The radios are required to comply with FCC Rules and Regulations as Part 15 devices. As such, they have limited transmitter power and therefore limited range.
• A receiver cannot respond to more than one transmitted signal at a time and may be blocked by radio signals that occur on or near their operating frequencies, regardless of code settings.
• Changes or modifications to the device may void FCC compliance.
• Infrequently used radio links should be tested regularly to protect against undetected interference or fault.
• A general knowledge of radio and its vagaries should be gained prior to acting as a wholesale distributor or dealer, and these facts should be communicated to the ultimate users.

FCC NOTICE

Changes or modifications not expressly described in this manual or approved by the manufacturer could void the user’s authority to operate the equipment.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
• Reorient or relocate the receiving antenna.
• Increase the separation between the equipment and receiver.
• Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
• Consult the dealer or an experienced radio/TV technician for help.
